Experience

AI Engineer (Contract), Goop

Aug 2026 – Present

- Shipped a multi-tenant, omni-channel agent (TypeScript, Node.js) that turns informal, scattered context (Slack messages, meeting notes, voice notes) into structured tasks across Slack, Notion and Granola
- Replaced a 3-hour, 125-case manual test matrix with 42 scored evals that drive the agent through real sessions and grade its tool calls and replies, catching prompt and tool regressions before every deploy
- Cut average model-call latency from 8.2 s to 2.6 s and calls per conversation from 4 to 2.5 by tracing turn time, pinning provider order and offloading routing decisions to Jev, a typed-decision model

Co-founder, crescō

June 2026 – Present

- Co-founded an AI-first software factory that generated \$22,000 in its first 4 months
- Processed \$40,000+ in payments through a customer payment portal (Next.js, NestJS) that accepts Stripe, PayPal, Binance, Zelle and bank transfers, confirming every payment automatically
- Built a dual-currency, double-entry ledger (NestJS, PostgreSQL) that records every invoice and payment for a logistics company, matching payments to invoices to the cent from a reconciliation inbox fed over SFTP
- Developed an engineering agent (TypeScript, Node.js) that turns production alerts into deduplicated GitHub issues, then reproduces and fixes the bug in a Docker sandbox and opens a tested PR in about 30 minutes

Software Engineer, Venezolano de Crédito (largest corporate bank in Venezuela)

Sept 2022 – July 2025

- Designed a scalable RESTful API using Java, Spring Boot and SQL that securely allows outside parties to access bank's financial services, facilitating 10,000+ users and supporting 50,000+ daily operations
- Led a 5-person technical team in delivering continuous features and updates to a Flutter mobile app, meeting user needs and driving a 30% increase in store reviews that boosted the app's rating
- Developed and implemented a supervised financial transaction classification model using a bag of words and random forest, enabling personalized financial recommendations and targeted marketing campaigns
- Integrated with a third-party tax administration service to provide online tax payments through a full-stack web app made using Java and ReactJS, resulting in \$500,000+ collected thus far
- Built a JavaScript library that generates and scans QRs with users' public banking information, easing the exchange of data and increasing by 10% the amount of daily P2P operations
- Optimized query execution times of an Oracle database supporting multiple internal systems by partitioning large tables and creating materialized views, improving the systems' responsiveness and eliminating timeouts

Projects

Rover – Amazon arbitrage agent (Python, SQLite, Selenium, MCP)

github.com/pestanadiego/rover

- Built a 10-stage pipeline that runs unattended 3 times a day, scheduling keywords, scraping a product research site, reviewing each listing with an LLM agent and emailing a ranked shortlist, earning \$1,218 in resale profit
- Judged every candidate with an LLM agent that pulls product records over a local MCP server, researches sourcing and cost on the web and returns a keep or reject decision with its reasoning
- Closed the feedback loop by tracking the winner rate of each keyword to retire losers, mutating proven keywords, generating new ones from winning product titles and pruning drift with embeddings

Skills

Languages: TypeScript, JavaScript, Java, Python, SQL

Technologies: Node.js, NestJS, PostgreSQL, SQLite, Oracle, React, Flutter, AWS, Docker

AI and Agents: Tool Calling, MCP, Agent Orchestration, Evals, Claude Code, Codex

Education

University of Kansas – M.S. in Computer Science

Expected May 2027

Universidad Metropolitana – B.S. in Systems Engineering

Feb 2024
